

I broke down the layout of the YouTube homepage by identifying and categorizing the main sections based on their function and visual structure.

First, I looked at the overall page and noticed that it is divided into different components that serve specific purposes, such as navigation, search, and content display. Using the labels in the image, I grouped similar elements together, like the Navbar, which contains the menu options, and the Header, which includes the search bar and logo. This helped me understand how each part contributes to the user experience.

Next, I focused on highlighting the Main Container, which holds all the video content, and within that, I identified smaller sections like Container Content (video listings) and Filters (options to refine searches). I also distinguished interactive elements like the Video Thumbnail, where users click to watch videos, and the Right Navbar, which includes profile and notification icons. My reasoning was to organize the layout in a way that clearly shows how different sections interact, making it easier to navigate and understand the webpage structure.
